

Manual Tank Gauging For Small Underground Storage Tanks

MANUAL TANK GAUGING

This leak detection method can be used for tanks 2,000 gallons and smaller only. Manual tank gauging may be used without tank tightness testing on tanks 1,000 gallons or smaller. Manual tank gauging must be used in combination with tank tightness testing for 1,000- to 2,000-gallon tanks.

Manual tank gauging consists of measuring product in the tank before and after a "rest period." Product input or output may not occur during the rest period. Two measurements, from which you will take an average, are required before and after each rest period. The chart on page 3 will tell you the length of the rest periods and the allowable product loss/gain standard for your tank's size and dimension.

TO PROPERLY CONDUCT MANUAL TANK GAUGING

You Must:

- Have proper equipment
- Stick the tank before and after the rest period
- Reconcile inventory weekly and monthly
- Document & save records for all items listed above

Proper Equipment

Minimum equipment needed includes:

- a non-sparking gauge stick (dipstick) that can be read in 1/8th-inch increments and is not warped or worn at the bottom,
- a calibration chart that converts gauge stick readings to gallons for your specific tank type and size

Stick readings before and after each "rest period"

The tank inventory must be measured twice and averaged before and after each "rest period." The more consistent the stick readings are, the more accurate the inventory will be. This means that product level should be read by the same person using the same stick and the same tank calibration chart. Consistency is vital!

Weekly and monthly reconciliation

NOTE: Under no circumstances should you attempt to artificially adjust numbers to make daily over/short numbers come out to zero (0). This would defeat the whole purpose of inventory control and could mask a leak.

Inventory readings must be reconciled weekly and monthly. (The chart on page 3 shows the reconciliation standard per week and per month.) The standard for allowable product loss or gain depends on the tank capacity and dimension. If you are short or over more than either the allowable weekly or monthly standard, you may have a leak. If this happens, carefully monitor your inventory for another month. If either of the standards are exceeded again, contact your federal or state UST agency.

Documentation

You must keep documentation of all monitoring for at least one year. This includes monthly manual tank gauging records and the latest tank tightness test results (if required).

Tank Capacity (gallons)	Tank Dimensions	Weekly/Monthly Standard (gallons)	Minimum Rest Period Duration
550	N/A	10/5	36 hours
551 - 1,000	N/A	9/7	36 hours
1,000	64"(diameter) X 73 (length)	9/4	44 hours
1,000	48"(diameter) X 1 28"(length)	12/6	58 hours
1,001 - 2,000	N/A	26/13	36 hours

Steps To Follow For Using Manual Tank Gauging Record Sheet.

- 1 Stick the tank twice before the rest period and average the readings.
- 2 Allow no product input or withdrawal during the rest period, which is a specific time period based on your tank's size and dimension (see chart on page 5).
- 3 At the end of the rest period, stick the tank twice and average the readings.
- 4 Reconcile the stick readings on both a weekly and monthly basis and compare overages/shortages to the allowable ranges on the chart. If the overage/shortage figure exceeds the allowable range, carefully watch the inventory for another 30 days. If the trend continues, contact your UST implementing agency.
